# Revisiting Sample Frame and Mode Effects: A Comparison of Point Estimates

Nancy A. Mathiowetz, University of Wisconsin-Milwaukee

J. Michael Brick, Westat

Sarah Cho and Jon Cohen, SurveyMonkey

Ruth Igielnik, Scott Keeter, Andrew Mercer, and Kyley McGeeney, Pew  
Research Center

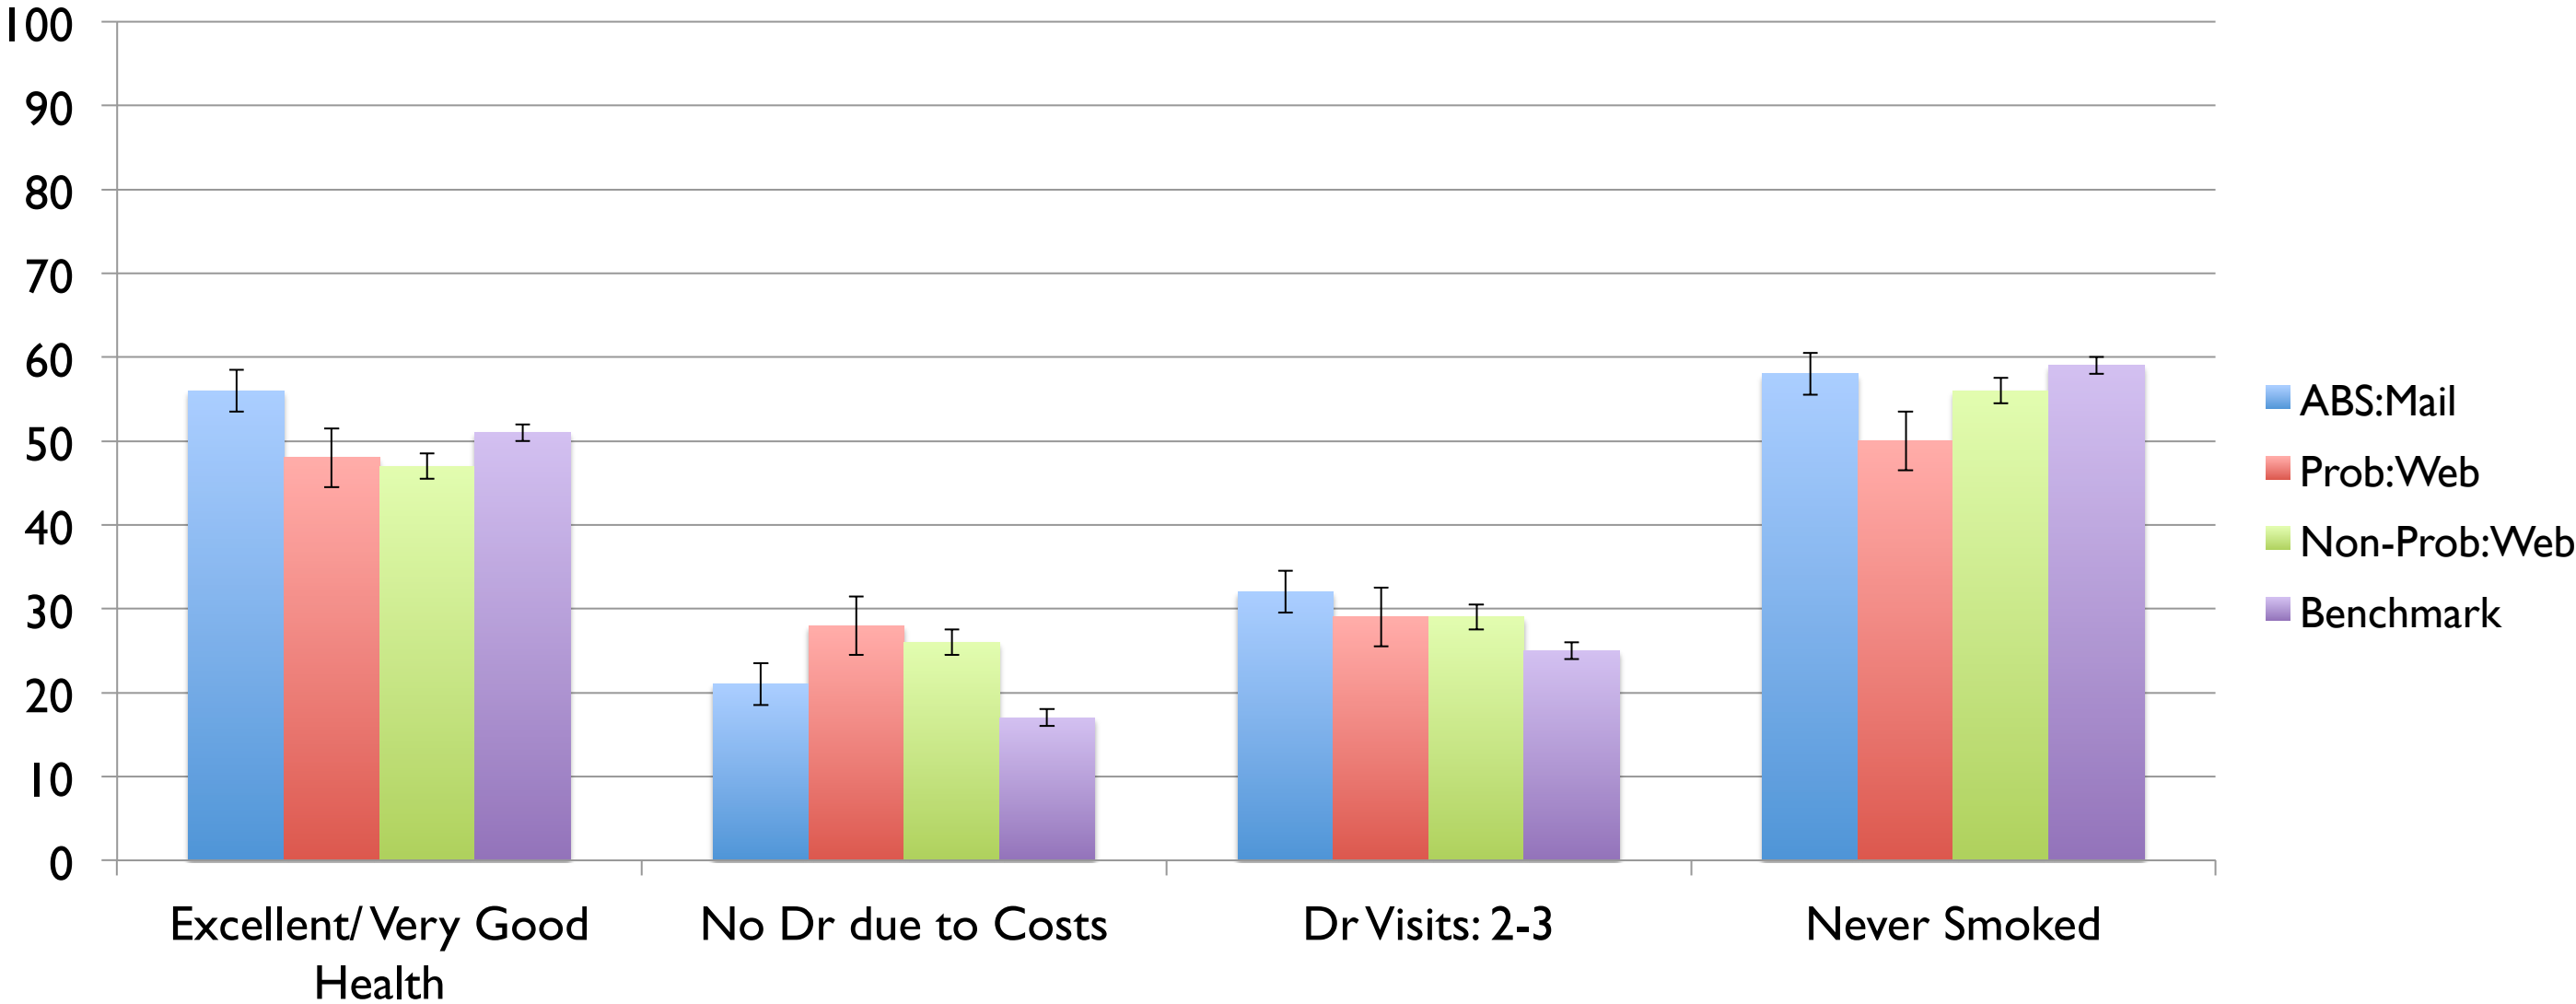

# Benchmarks

---

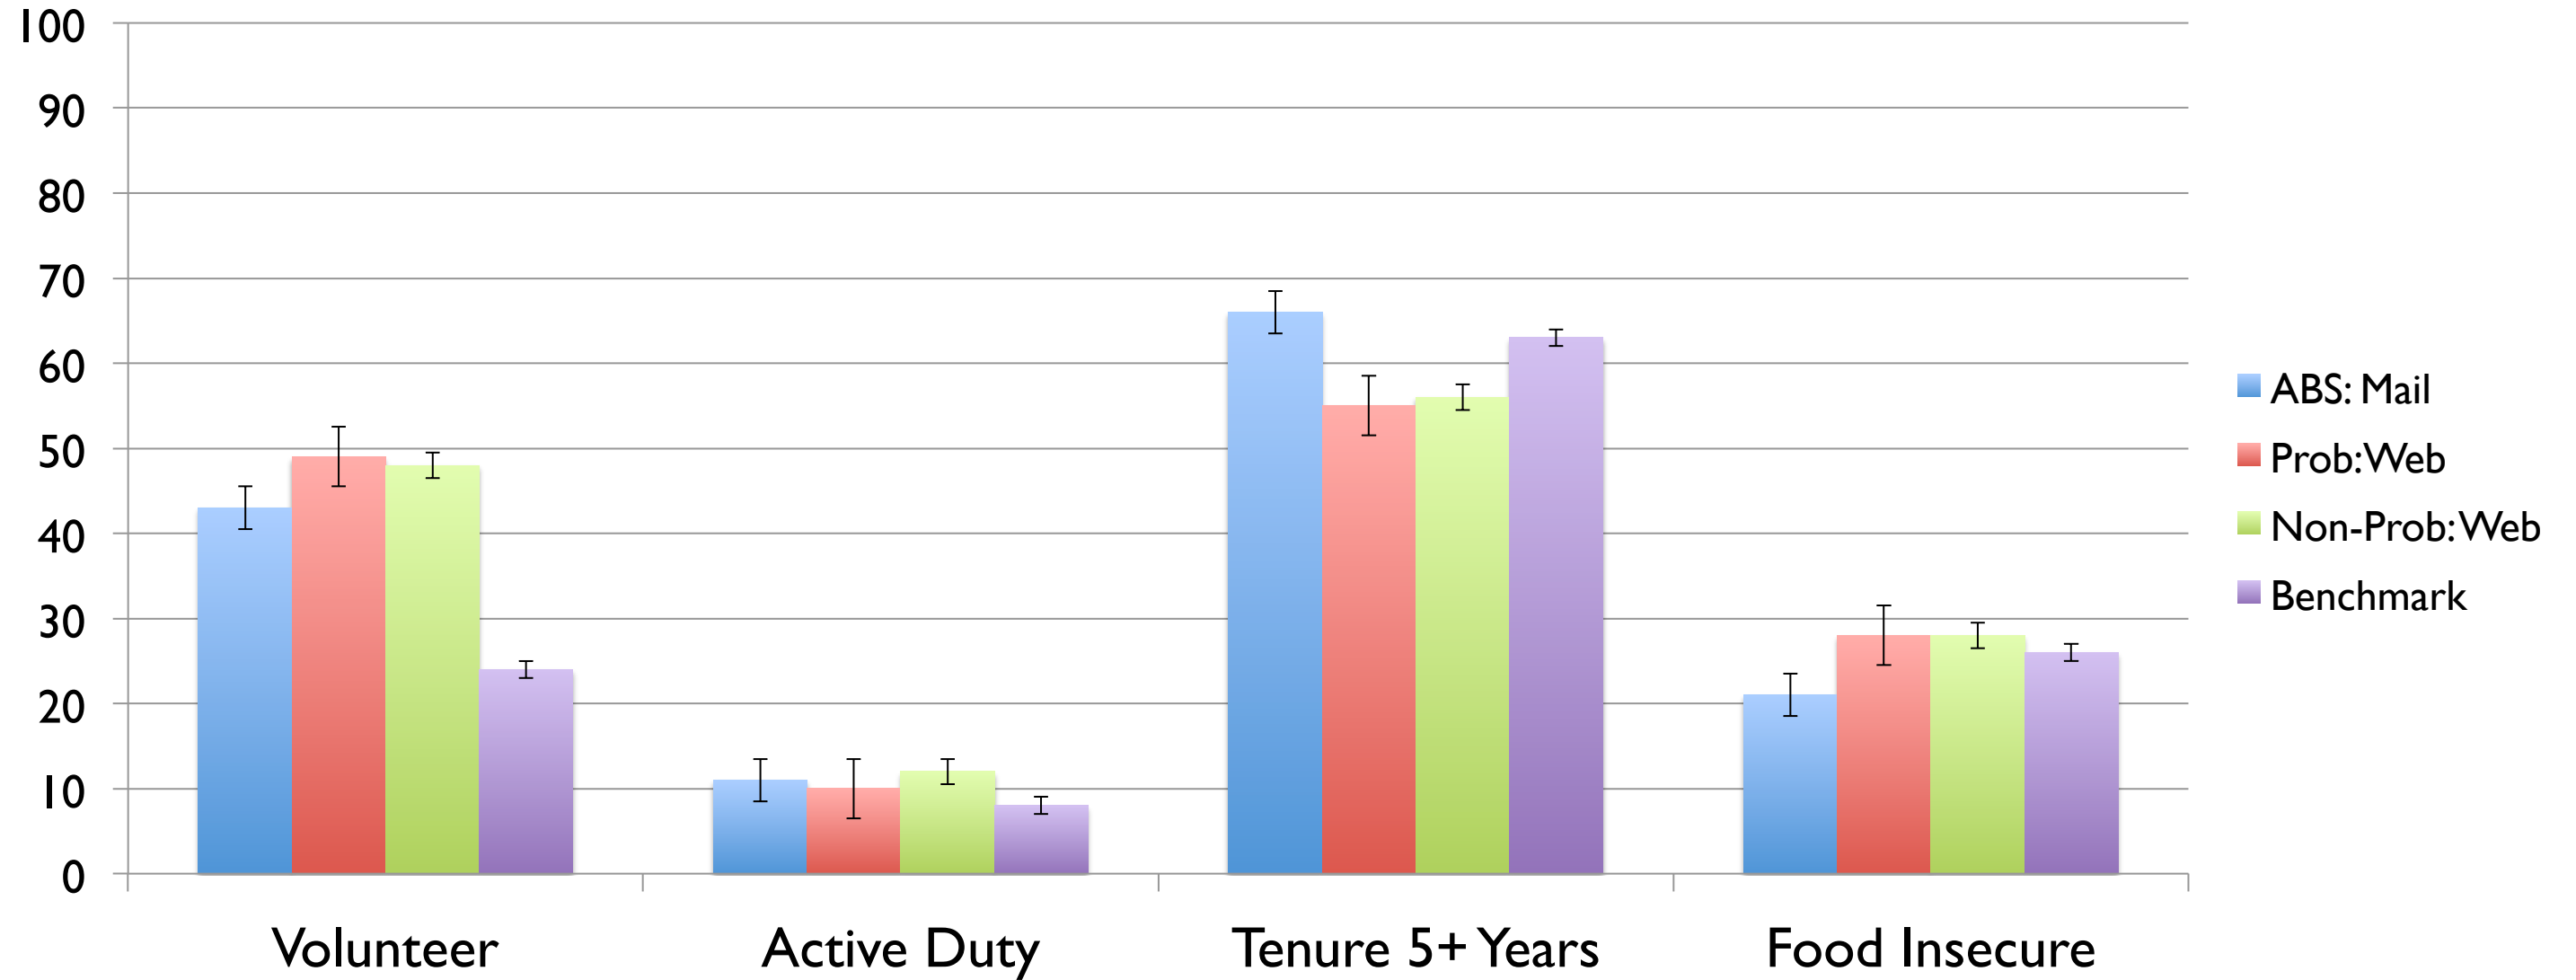

- American Community Survey
- Current Population Survey
  - Internet Supplement
  - Supplement on Volunteering
- National Health Interview Survey

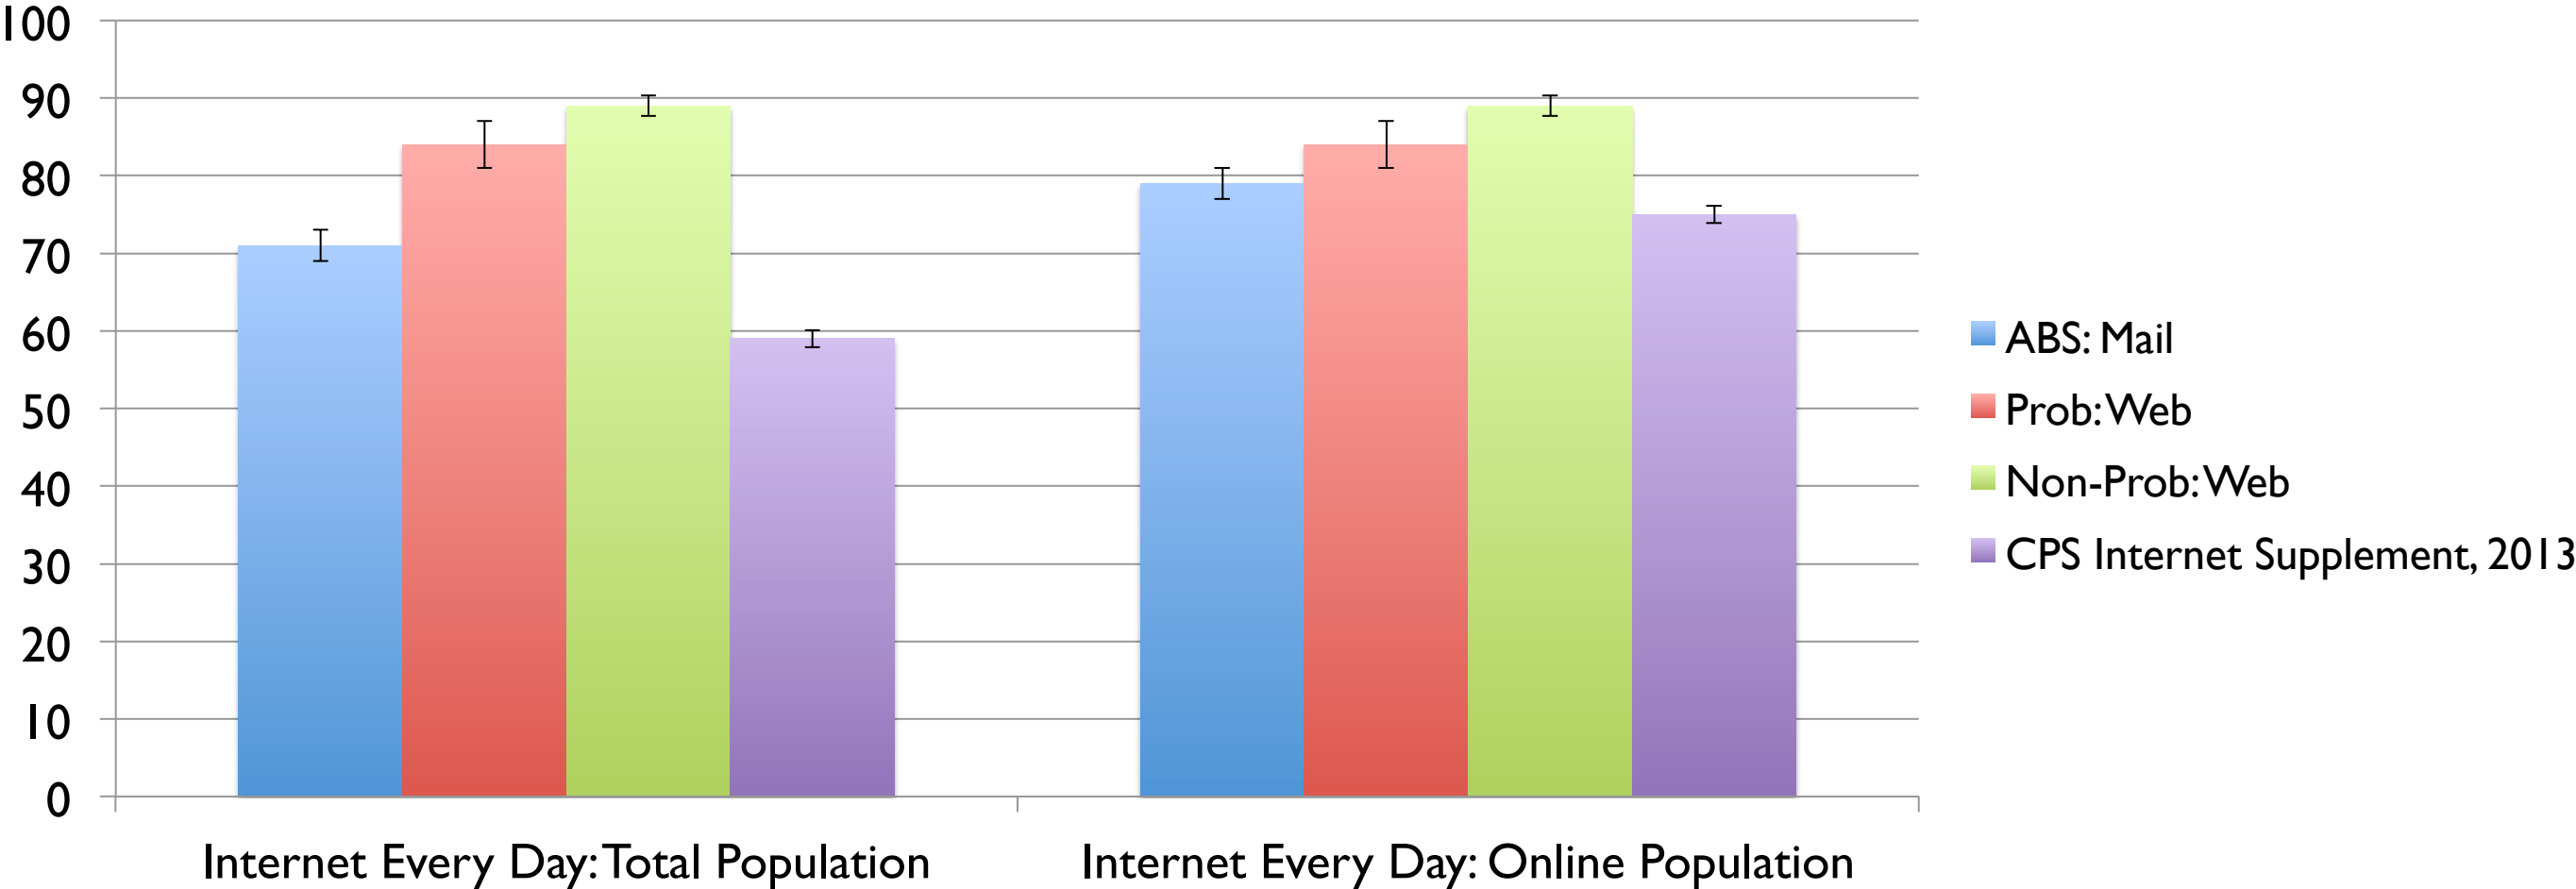

# Estimates and Benchmarks: Health Items

# Estimates and Benchmarks: Volunteer, Active Duty, Home Tenure, and Food Insecurity

# Internet Use Every Day: Expected Differences; Differences not eliminated by weighting

# Summary: Point Estimates

---

- Median Difference between sample and benchmark
  - ABS: 5.4 percentage points
  - Probability-based Web: 9.1 percentage points
  - Non-probability based Web: 6.5 percentage points

# Do the samples lead to different predicted probabilities?

---

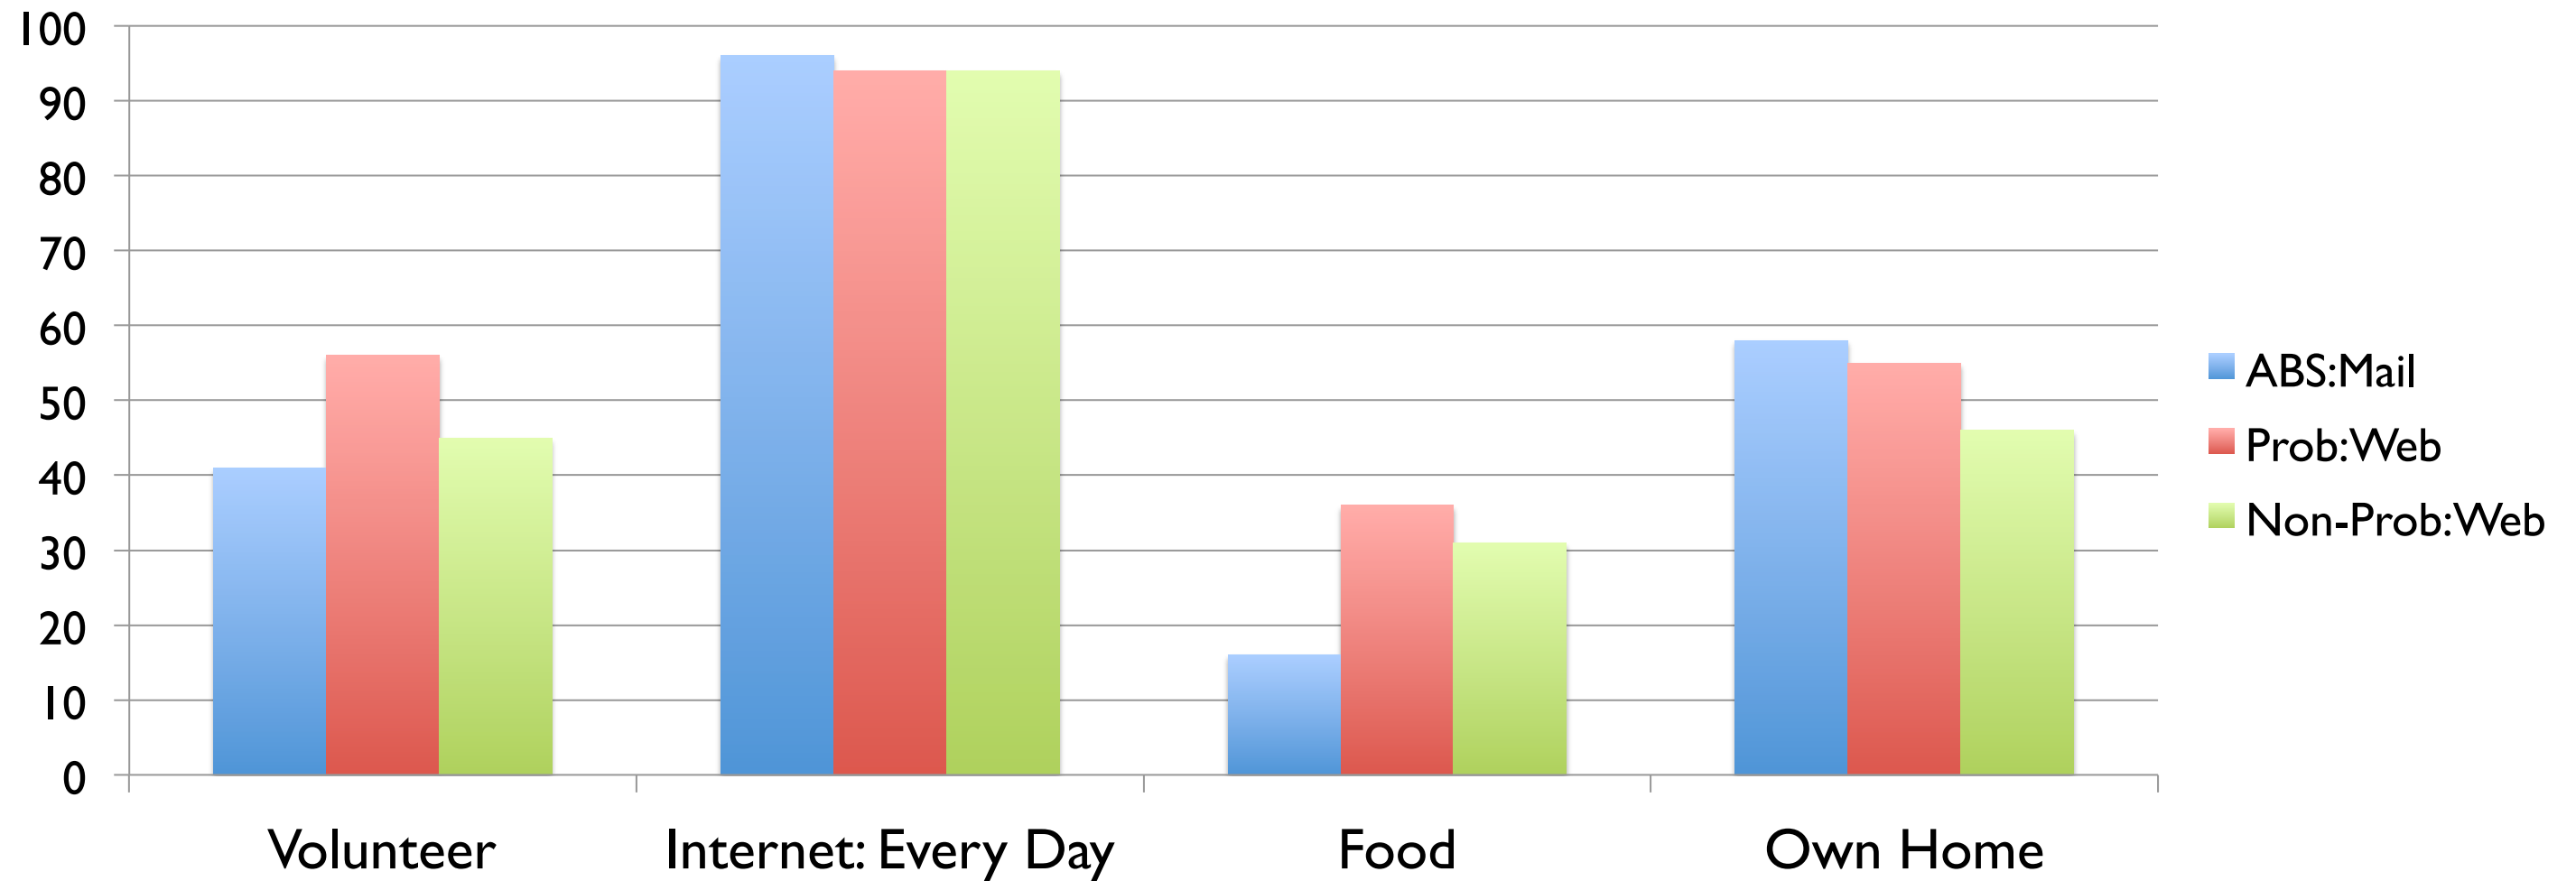

- Logistic regression models for each of the samples
- Independent Variables
  - Gender, age, Race, Education, Income, Currently Employed
  - Not necessarily great models, but consistent!

# Predicted Probabilities: Illustrative case

Female, 25-34 years of age, white, some college, \$40,000-\$99,999, employed

# Predicted Probabilities—health items

# Conclusions

---

- Point estimates:

- No one design consistently superior when compared to benchmarks

- Variability we would expect

- The findings suggest that estimates from the ABS differs from both the non-probability and the probability web surveys

- Coverage and mode confounded

- Multivariate models (not shown) show surprisingly few differences with respect to direction or significance

- Although the size of the coefficients in these models were substantively different—evident in the predicted probabilities

# Potential Additional Weighting Variables

Weighted demographics	Thanks Page	Audience
Have children under 18 in HH	31%	22%
Currently married	56%	47%
<i>Religious attendance</i>		
More than once a week	11%	9%
Once a week	22	16
A few times a month	12	9
A few times a year	27	26
Never	25	39
Identify as having no religion	16%	24%

# Predictors of Completion Rates in Online Surveys

Noble Kuriakose

# Data

---

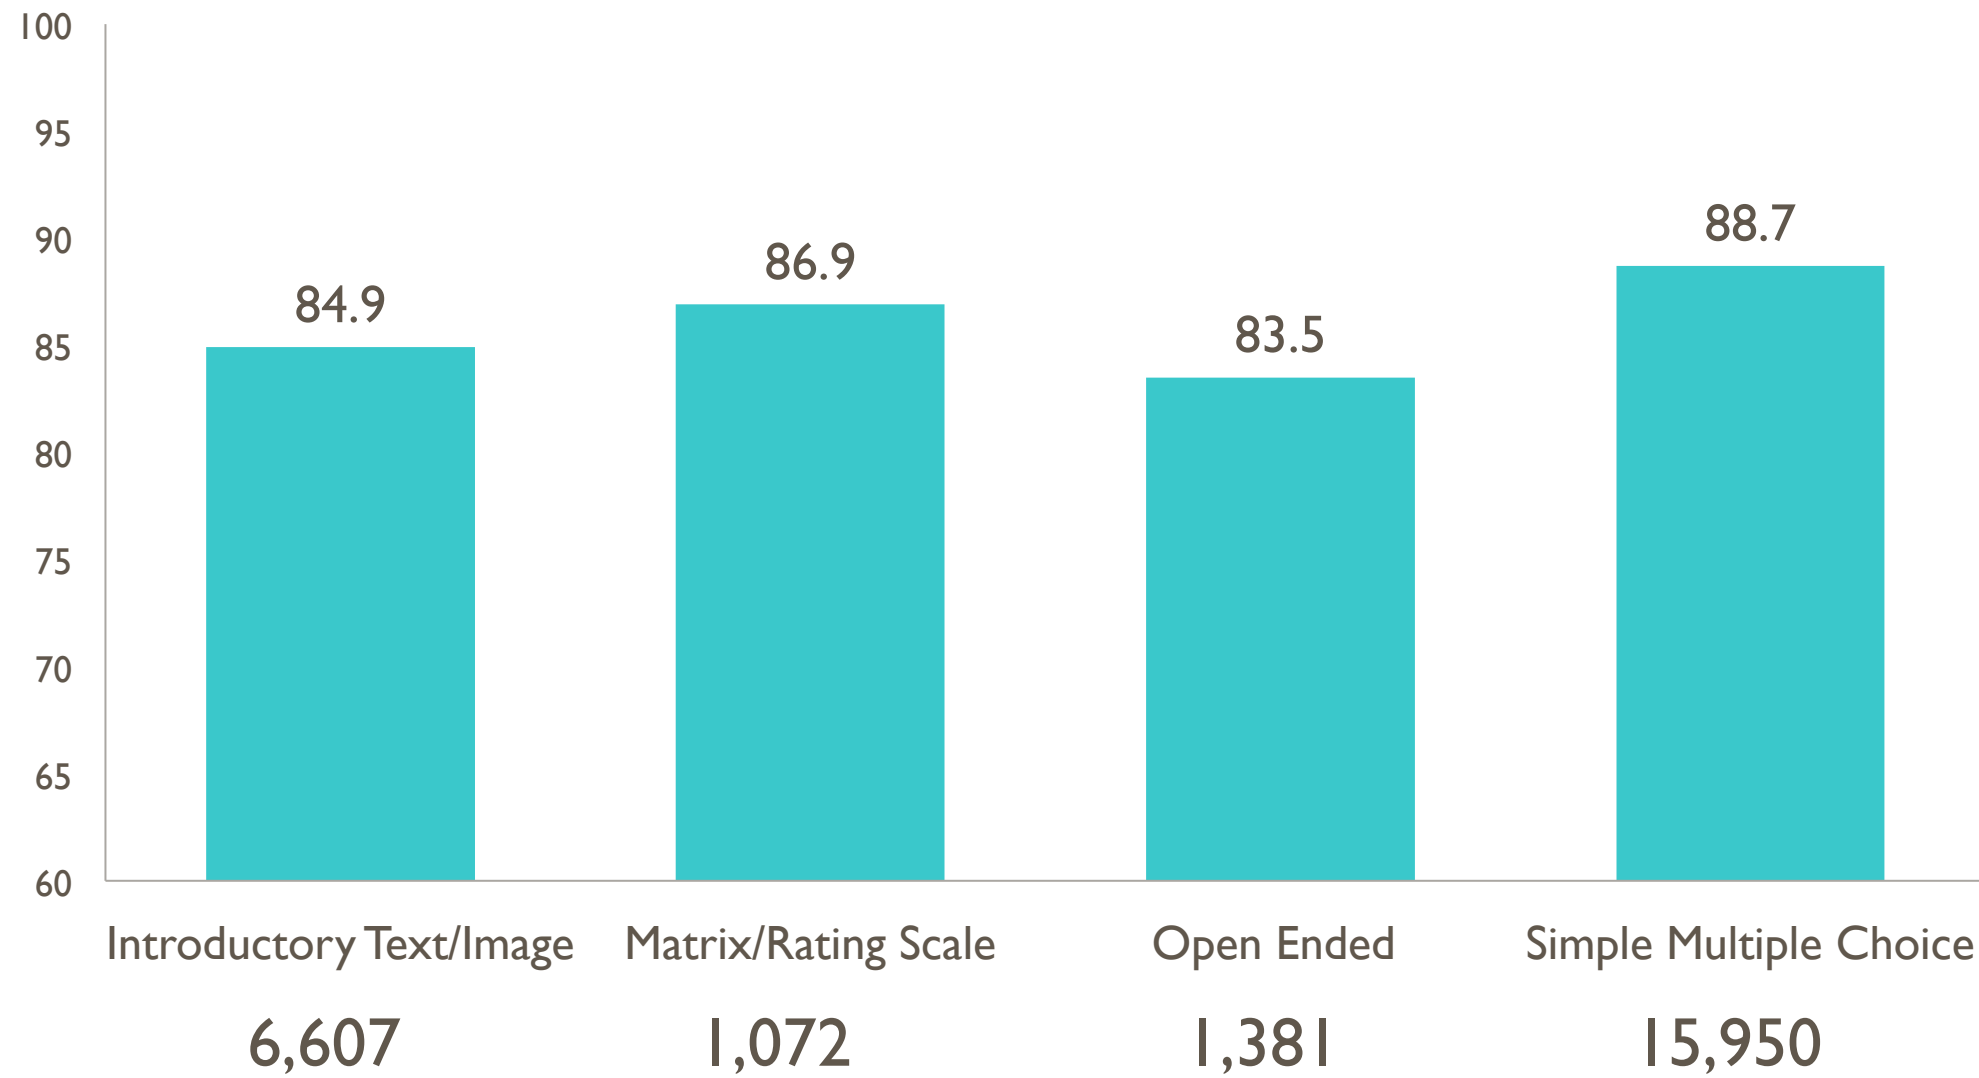

25,080 customer surveys

- Administered on SurveyMonkey's online panel, Contribute
- Conducted between May 2011 and April 2015
- At least 100 respondents per survey

# Findings – Start simple

Mean Completion Percentage by Type of Opening Question

# Findings – As with any survey, limit questions

## Mean Completion Percentage by Number of Questions

At least 100 surveys in each category.

# Findings – Avoid multiple tough questions

## Mean Completion Percentage by Number of Questions

At least 100 surveys in each category.

# Findings – What matters most?

---

## OLS Regression, Highest (Absolute) Standardized Beta Coefficients

<b>Variable (ref. group)</b>	<b>Beta</b>
# of Open Ends- 5 or more (1)	-0.19
# of Words in Question Text (continuous)	-0.11
# of Answer Options (continuous)	-0.11
# of Words in Opening Question Text (continuous)	-0.10
# of Open Ends- 3 (1)	-0.09
<b># of Open Ends- 0 (1)</b>	<b>+0.09</b>
# of Open Ends- 4 (1)	-0.07
# of Matrix Qs- 5 or more (1)	-0.07
<b># of Matrix Qs- 0 (1)</b>	<b>+0.05</b>

All Coefficients are stat. sig. at  $<.0001$

# Conclusions

---

- Survey meta and para data explain 20% ( $R^2$ ) of the variance in completion percentages— ignoring the type and content of the survey.
- As with all surveys, aim to reduce respondent burden
  - Respondents penalize surveys for making them use their keyboards
  - Avoid blocks of text in the question

---

Thanks for  
listening!
